## HOPES

## EARS

We continue to iterate on our EDT practices	We have a product that meets our plan	reflection materia from the	Slack becomes more utilised	We appropriately factor in security	We use testing throughout	We get 3p from Tom		We don't finish a MVP	We struggle with technical requirements	communication breaks down	Ugly product		We drown in requirements and planning	Rush through implementation
Our communication only gets better from here	We incorporate Stripe as a payment option	The end product looks good						Security becomes an afterthought	Testing becomes a chore	Don't hit LO's				
Semi- finished application	Implement all of our MVPs	Meet majority of our Learning Outcomes	have a login system connected to a db	one API used	remain	up		Team members lose interest	connected	No API used	Jira board going haywire	Lack of organization	Bad design	Bad file structure
good design all round		test documentation	consistent test reports						team members not being heard throughout project					
hat i might a thick it all 5 LO's the for S1	e will have an MVP by the end of the sprint	Semmunication improves	et meeting Watimes for range structre	Ve get some noney from tom, stolen from green	WIII learn a ot from this project		F	lears that I might not omplete all LO's	We might not have time to mplement all features we would like	Jira might become overencumbered				
That we have rking end pro	$\sim$ duct	Have goo documentatio					S	lot to go those 5 teps overboard	with the	ot too much docur or the end product	because
